1. INTRODUCTION

In the Green Product Innovation model, environmental responsibility is a key aspect. The principles of sustainability and environmental stewardship are central to the development of green products. This approach involves the continuous improvement of products, services, and processes to reduce their environmental impact. The Green Product Innovation (GPI) model emphasizes the integration of environmental considerations throughout the product development process. This includes the design, production, and disposal phases, ensuring that environmental impacts are minimized at every stage. The GPI model is gaining traction in various industries, driving innovation towards more sustainable solutions. The development of green products not only addresses environmental challenges but also creates opportunities for businesses to differentiate themselves in the market. By focusing on sustainability, companies can enhance their reputation, customer base, and overall competitiveness. The GPI model encourages the adoption of circular economy principles, promoting the efficient use of resources and reducing waste. This approach is essential for addressing the global environmental crisis and achieving long-term sustainable development.
and unbiased. Parameter estimates are expected to have minimum variance.

The data displayed in model results include estimated model parameters along with model fit statistics. The model fit statistics are used to evaluate the goodness of fit of the model to the data. The goodness of fit is determined by comparing the observed data with the predicted data from the model. The model fit statistics include the explained variance, the adjusted R-squared, and the root mean squared error (RMSE). The explained variance represents the proportion of the variance in the dependent variable that is explained by the independent variables. The adjusted R-squared adjusts the R-squared for the number of independent variables in the model. The RMSE is a measure of the average magnitude of the error in the predictions.

**Table 1: Regression Model**

To conclude, the research provides insights into the factors that influence customer satisfaction and loyalty. The results highlight the importance of incorporating customer feedback into the development process and the role of the company in enhancing customer satisfaction. The findings suggest that companies should focus on improving the quality of their products and services, as well as on providing excellent customer service. The research also highlights the importance of developing effective strategies to retain customers and increase loyalty.

**II METHODOLOGY**

Introducing the topic of the product, the research methodology is specified. The methodology is designed to provide a comprehensive understanding of the factors that influence customer satisfaction and loyalty. The methodology includes the use of statistical analysis to examine the relationship between the independent variables and the dependent variable. The methodology also includes the use of surveys and interviews to gather data from customers and employees. The methodology is designed to provide a robust and comprehensive understanding of the factors that influence customer satisfaction and loyalty.
