

ABSTRACT

Currently there are quite a lot of government officials to tackle poverty in Indonesia. One such program is PNPM Mandiri Perdesaan. PNPM Mandiri Perdesaan is a program set up specifically to empower rural communities to create facilities and infrastructure that can support community life in the countryside. It is hoped that such assistance can improve the welfare of the economy, education and health so that people in the village no longer need to urbanize to the city to improve the welfare of his life.

The information system for monitoring economic poverty assistance is a system that can monitor and monitor data, performance and quality in the implementation of eradication of poverty with social assistance program of PNPM Mandiri in Rural Area. This system is designed using the SDSADM / Structure System Analyzer and Design Method methodology. This system serves to perform data verification accurately and can monitor the activity of village development activities. In addition, this system can also support the monitoring of aid funds that have been disbursed by the government.

The end result of this research is expected to help the government, especially the District to be able to monitor the progress of village development activities using social assistance funds PNPM Mandiri In Rural to minimize the occurrence of criminal acts such as corruption and money laundering crime.
