ABSTRACT

This study aims to get the data of bird species found in the region Situ Gunung Gede Pangrango Mountain National Park, West Java. The method used is descriptive method with a design point count. The results of the identification of bird species, obtained 35 species of birds. Included in the 6 Ordo, 20 Family, 30 Genus. These results indicate a decrease in the number of bird species in Situ Gunung area due to the influence of hunting and the location of research is a tourist attraction (ecotourism), so that birds are disturbed by human activities. Bird species most commonly found are Walet linci (Collocalia Linchi). Family highest percentage is Nectariniidae gained 12%. Ordo highest percentage Passeriformes acquire 71%, Found 10 species of protected birds in the region Situ Gunung. Birds found in it has composition the number as many as 12,11 % of the birds in Java.
