ABSTRAC

This study aims to determine whether powerpoint learning media can improve learning outcomes or actually reduce student learning outcomes at school, and also to determine what effect makes a powerpoint learning media increase or decrease. This study uses a library research method using a qualitative approach, by looking for journals/previous studies that have similar research titles/points. There are more than 10 journals/previous studies that researchers analyze in them. The results of the analysis found that there was an effect of increasing learning outcomes from the use of powerpoint learning media, even getting good results, especially if learning using powerpoint media was packaged creatively, because based on the results of the analysis there was a conclusion that students could pay more attention or understand the material if it was packaged well. Interesting animations, pictures and videos.
