

ABSTRACT

Education must be able to adapt to an increasingly modern era. The advancements of the world are found in the field of technology, making the use of technology during learning necessary to create students who are not technologically illiterate. The development of education in this modern era requires appropriate methods that utilize technology. To be able to use this technology, students must have digital skills, namely digital literacy. Therefore, in this research, the method used is Blended Learning, which aims to improve the digital literacy of the students. The research method employed is quantitative. The research results based on the n-gain scores indicate a sufficient criterion, which means that this teaching method is effective in improving students' digital literacy.

Keywords: education, technology, blended learning, digital literacy
